

Troubleshooting Guide

Langkah Debugging

1. Test Basic Setup

1. Buka: `http://180.251.120.19:8081/image-search/`
2. Klik tombol **"Test PHP"** - harus muncul alert "PHP is working!"
3. Klik tombol **"Test Connection"** - akan menunjukkan status sistem

2. Error: "search_ima... is not valid JSON"

Penyebab: Server PHP mengembalikan HTML error atau text bukan JSON

Solusi:

1. Buka browser dev tools (F12)
2. Lihat tab Console untuk error detail
3. Lihat tab Network untuk response actual dari server
4. Kemungkinan penyebab:
 - PHP syntax error
 - Server path salah
 - Permissions issue

3. Error: "Cannot access network path"

Solusi:

1. Manual Mount Network Drive:

```
cmd

# Buka Command Prompt sebagai Administrator
net use Z: "\\192.168.0.204\Master Design" /user:USERNAME PASSWORD

# Test akses
dir Z:
```

2. Alternatif UNC Path:

- Edit `search_images_simple.php`
- Ganti `$possiblePaths` dengan path yang tepat

4. Error: "HTTP 404" atau "File not found"

Penyebab: File PHP tidak ditemukan

Solusi:

1. Pastikan struktur folder benar:

```
xampp/htdocs/image-search/  
├── index.html  
├── search_images_simple.php  
├── test_simple.php  
└── test_connection.php
```

2. Akses langsung file PHP di browser: `http://180.251.120.19:8081/image-search/test_simple.php`

5. Error: "CORS" atau "Cross-origin"

Penyebab: Browser memblok request karena CORS

Solusi:

1. Pastikan file `.htaccess` ada dengan content CORS headers
2. Atau disable CORS di browser untuk testing:
 - Chrome: `--disable-web-security --user-data-dir=/tmp`

6. Error: "Permission denied" atau "Cannot write"

Penyebab: PHP tidak punya permission untuk buat folder/file

Solusi:

1. **Windows:**

```
cmd  
  
# Beri permission pada folder xampp/htdocs/image-search  
icacls "C:\xampp\htdocs\image-search" /grant Users:F /T
```

2. **Manual create folder:**

- Buat folder `images/` di dalam folder `image-search/`
- Set permission write untuk folder tersebut

7. Network Drive Mount Issues

Windows Authentication:

cmd

Dengan domain

net use Z: "\\192.168.0.204\Master Design" /user:DOMAIN\username password

Tanpa domain

net use Z: "\\192.168.0.204\Master Design" /user:username password

Persistent mount

net use Z: "\\192.168.0.204\Master Design" /user:username password /persistent:yes

Test Network Access:

cmd

Test ping

ping 192.168.0.204

Test SMB access

net view \\192.168.0.204

List shares

net view \\192.168.0.204

8. PHP Configuration Issues

Check PHP Settings:

Buat file `phpinfo.php`:

php

```
<?php phpinfo(); ?>
```

Required Extensions:

- `extension=gd` (untuk image processing)
- `extension=exif` (untuk image info)
- `allow_url_fopen = On` (untuk network access)

9. Apache/XAMPP Issues

Check Apache Error Log:

- Path: `xampp/apache/logs/error.log`
- Look for PHP errors atau access denied

Enable mod_rewrite:

- Edit: `xampp/apache/conf/httpd.conf`
- Uncomment: `LoadModule rewrite_module modules/mod_rewrite.so`

Quick Fixes

Fix 1: Simple Test Search

1. Ganti isi `search_images_simple.php` dengan mock data:

```
php

<?php
header('Content-Type: application/json');
header('Access-Control-Allow-Origin: *');

echo json_encode([
    'success' => true,
    'query' => $_GET['q'] ?? 'test',
    'count' => 1,
    'images' => [
        [
            'name' => 'test.jpg',
            'url' => 'https://via.placeholder.com/300x200.jpg?text=Test+Image',
            'size' => 12345,
            'path' => 'test/path'
        ]
    ]
]);
?>
```

Fix 2: Use Local Images for Testing

1. Buat folder `test-images/` di dalam `image-search/`
2. Copy beberapa JPG files ke folder tersebut
3. Modify `search_images_simple.php` untuk scan local folder

Fix 3: Alternative API Endpoint

Jika semua gagal, ganti URL di JavaScript:

```
javascript

// Gunakan API testing online
const apiUrl = `https://jsonplaceholder.typicode.com/photos?_limit=10`;
```

Debug Commands

Browser Console:

```
javascript

// Test fetch manually
fetch('/test_simple.php?q=test')
  .then(r => r.text())
  .then(console.log)
  .catch(console.error);

// Test CORS
fetch('/search_images_simple.php?q=test', {
  method: 'GET',
  mode: 'cors'
}).then(r => r.text()).then(console.log);
```

PHP Debug:

Add to PHP files:

```
php

// Enable error display
ini_set('display_errors', 1);
error_reporting(E_ALL);

// Add debug output
error_log("Debug: " . print_r($_GET, true));
```

Common Solutions Summary

1. **JSON Parse Error:** Check PHP syntax, use browser Network tab
2. **Network Access:** Mount drive properly with correct credentials
3. **File Permission:** Set write permissions on images/ folder

4. **CORS Error:** Add proper headers in PHP or .htaccess
5. **404 Error:** Check file paths and XAMPP configuration

Still Not Working?

1. Try `search_images_simple.php` with mock data first
2. Check XAMPP Apache and PHP are running on correct ports
3. Test with simple HTML file without JavaScript fetch
4. Check Windows Event Viewer for system-level errors
5. Try different browser or disable browser security for testing
